

# How to resize a TPanel at runtime

---

You should add a *WS\_SIZEBOX* constant to the your panel window style:

```
type
  TMyNewPanel = class(TPanel)
  protected
    procedure CreateParams(var Params: TCreateParams); override;
  end;
...
procedure TMyNewPanel.CreateParams(var Params: TCreateParams);
begin
  inherited CreateParams(Params);
  Params.Style := Params.Style or WS_SIZEBOX;
end;
```

See *Tip #92* for a different approach to making a resizable panel that uses a size grip and hit testing.
