

# How to detach and re-attach an event

---

If, for any reason, you want to detach (remove) the code you have written in an event handler, you have to set the event handler to nil.

```
procedure TForm1.Button1Click(Sender: TObject) ;
begin
  ShowMessage('Who clicked?') ;
  //remove event handler from event
  Button1.OnClick := nil;
end;
```

To re-assign the procedure *Button1Click* to the button's *OnClick* event, you should use:

```
Button1.OnClick := Button1Click;
```
