

Find the taskbar and system tray window handles

The task bar is a top level window which has class name "Shell_TrayWnd". We can find it using the Windows *FindWindow* API function as follows:

```
function TaskbarHandle: THandle;  
begin  
    Result := FindWindow('Shell_TrayWnd', nil);  
end;
```

The system tray is a child window of the task bar which has class name "TrayNotifyWnd". Because it's a child window, we need to use the *FindWindowEx* Windows API function, passing the task bar's handle as the parent:

```
function TrayHandle: THandle;  
begin  
    Result := FindWindowEx(TaskbarHandle, 0, 'TrayNotifyWnd', nil);  
end;
```

You can find *both these routines* in the *Code Snippets Database*.
