How to control the scroll buffer of a TMemo

QUESTION

I would like the *TMemo* object to have a 250 line scroll buffer. In other words, when the 251st line is added, the first line is removed from the *TMemo* object. Is there a way to accomplish this without having to copy each string from index n to index n - 1 each time the 250th line is added?

You can use *TStrings'* *Delete* method and pass the index to it.

```
if memo1.Lines.Count = 251 then
  Memo1.lines.Delete(0);
```
